Spectral Signatures

# What is Remote Sensing

Science of obtaining  
information about objects or  
areas from a distance

# Timeline of Remote sensing

**1858**

**First Aerial photograph**

Gasper Felix Tournachon  
'Nadar'

**1908**

**Aerial reconnaissance**

Aerial reconnaissance cameras were used in airplanes to collect photographs

**2019**

**UAVs**

Fixed wing drones and multi rotor drones have revolutionized every aspect of human life.

**1903**

**Breast mounted camera for pigeons**

Cameras attached to pigeons were used to collect photographs from higher elevation.

**1960**

**Space photography**

Gemini and Apollo space photography through satellite platforms followed by Landsat satellites.

# Breaking down Remote Sensing

## Remote Sensing Components

Remote sensing in general consist of three main compulsory components for a complete transition from data collection up to useful information which helps in decision making.

### Sensor

Sensor will collect scattered or emitted energy from a target.

### Platform

The vessel which will accommodate the sensor in ground, air or space.

### Image processing

Conversion of raw collected data from sensors to useful information.

Q: Humans have 5 senses.

Sight  
Hearing  
Taste  
Smell  
Touch

Which of these are remote senses

# Everything in the world is due to a transaction of energy

In remote sensing, sensors collect/record electromagnetic radiation **scattered** or **emitted** by a target

Think about an  
ordinary  
camera

---

### ACTIVE SENSING

Remote Sensor emitting an energy source and detecting response off crop

Crop

### PASSIVE SENSING

Energy Source

Remote Sensor collecting Red, Green, Blue, NIR spectrum

Crop

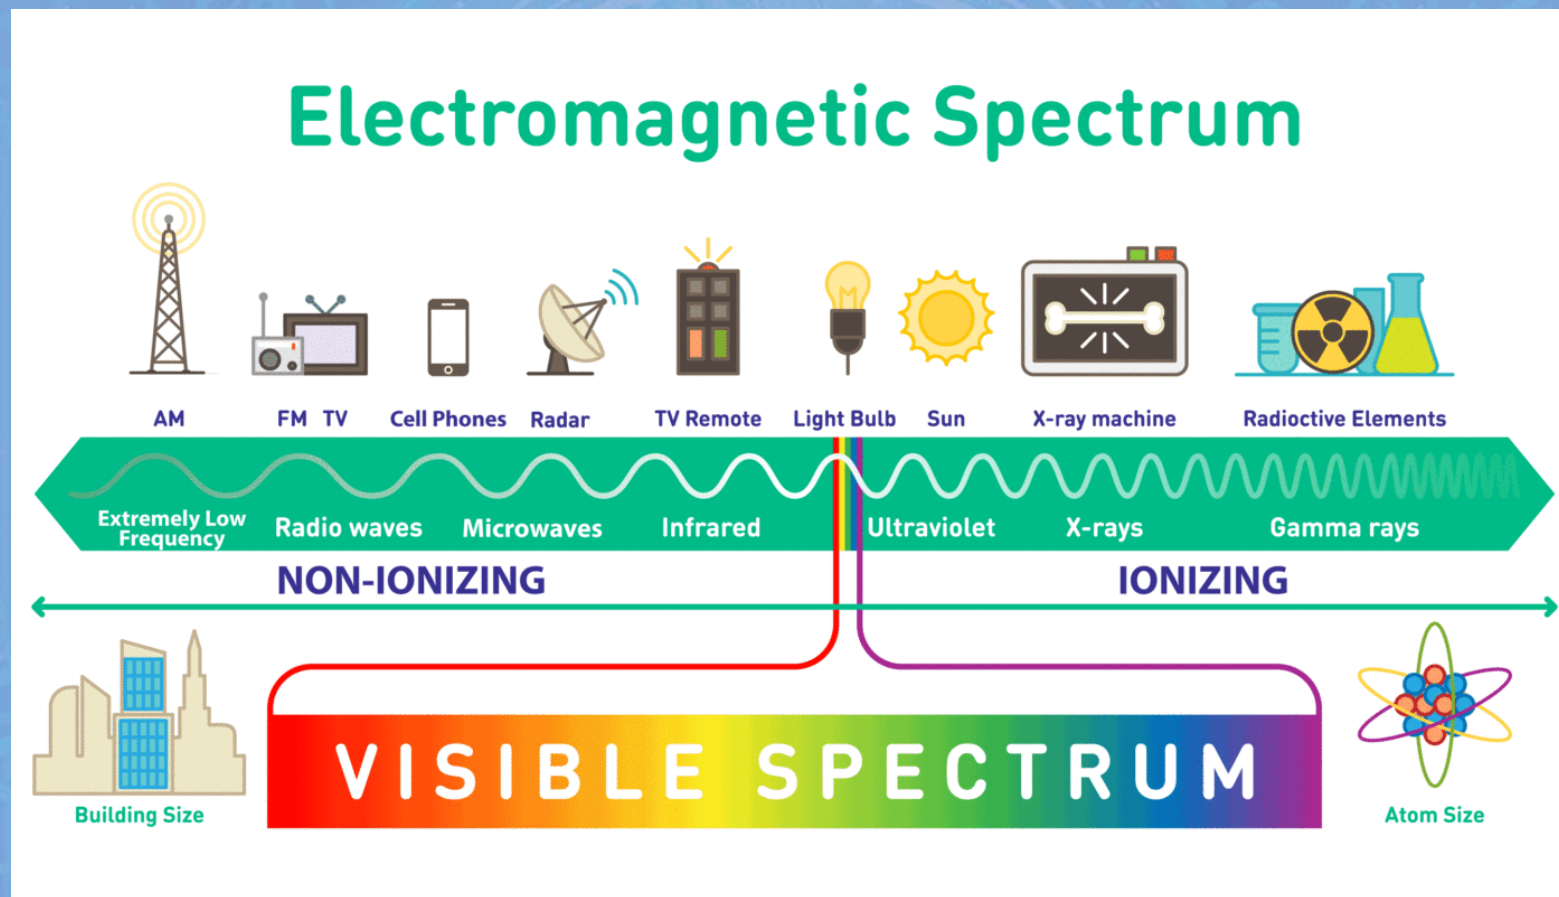

Q: Human eye is an active or passive remote sensor

Q: Human eye is an active or passive remote sensor

# Energy for remote sensing

What energy levels can sensors detect?

---

Q: Humans can't see in the dark. But how does a night vision goggle work?

Q: Different sensors can detect more than what the eye can see. How can we use this to detect anomalies in agriculture

Q: Different sensors can detect more than what the eye can see. How can we use this to detect anomalies in agriculture

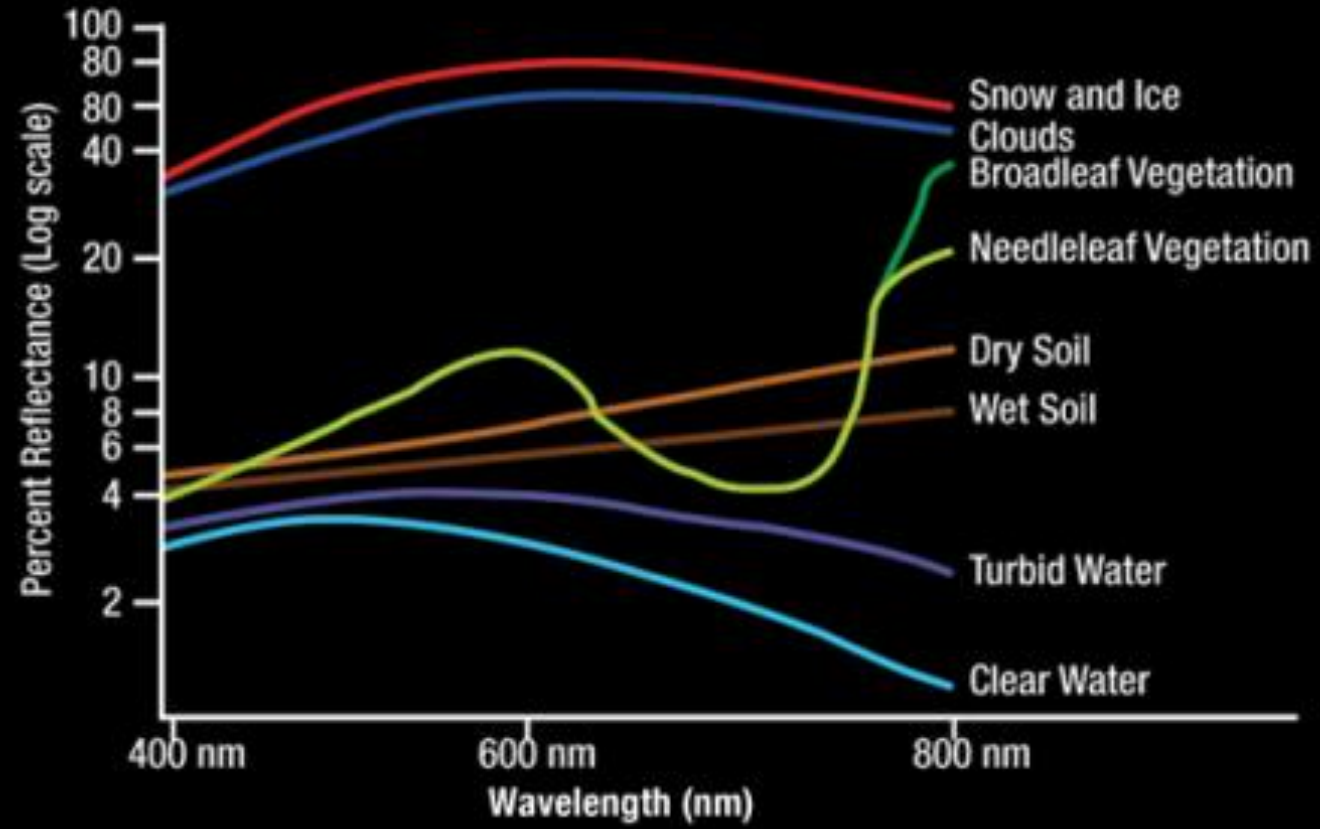

# Spectral Signature

*John Herbert ...* *W. J. Watson*

Different targets reflect and absorb different amounts of electromagnetic radiation giving them unique response to incident energy

### SPECTRAL SIGNATURES OF EARTH FEATURES
